CHAPTER I

THE PROBLEM AND REVIEW OF RELATED LITERATURE

Introduction

Education is fundamentally about meeting both personal and collective human needs. It equips individuals with the knowledge, skills, and attitudes necessary to navigate everyday life, pursue meaningful careers, and make informed decisions. Foundational subjects such as reading, writing, mathematics, and science provide the essential tools for understanding the world, solving problems, and interacting meaningfully with others. Beyond these basics, education cultivates critical thinking, enabling students to analyze information, identify errors or biases, evaluate arguments, and approach complex issues with reasoned judgment. These skills are vital not only in academic settings but also in preparing students to engage as responsible citizens, adapt to societal changes, and navigate a rapidly evolving technological and cultural landscape.

Academics are structured around interconnected components that support learning and inquiry. Formal education is typically organized into sequential levels, beginning with early childhood education, progressing through primary and secondary education, and culminating in higher education or vocational training. Each level

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

builds upon the previous one, gradually increasing in complexity and specialization. Curricula vary across regions and institutions, but most programs emphasize core subjects including language arts, mathematics, science, social studies, and the arts, alongside practical skills such as communication, collaboration, and digital literacy. This structured progression not only strengthens knowledge acquisition but also fosters problem-solving abilities, resilience, and adaptive learning strategies that students will carry into their future studies and professional lives.

Research over the past several years has demonstrated the critical role of family support in motivating students to engage academically. Despite the growing body of literature, gaps remain regarding the specific experiences of students in different contexts, particularly those in the Grade 11 General Academic Strand (GAS). A systematic review by Singh and Patel (2022) highlighted a positive relationship between parental support and student motivation, yet much of the research focuses broadly on student populations, leaving the experiences of GAS students underexplored. Similarly, Reyes and Santos (2023) noted that studies conducted in the Philippines are often limited to major urban centers, making it challenging to generalize findings to other regions where socio-economic and cultural conditions differ. Chen et al. (2021) further emphasized that much of the existing research neglects the critical transition period from Grade 10 to Grade 12, a stage marked by increased academic responsibility, preparation for higher education, and emerging personal and career decisions. These studies underscore the importance of examining family influence within the specific context of Grade 11 GAS students,

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

whose motivation and academic engagement may be particularly sensitive to familial and environmental factors.

Academic success, however, is not solely determined by intelligence or ability. Motivation plays a decisive role in shaping how students approach their studies and persist in the face of challenges. Academic motivation is defined as the internal and external factors that stimulate a student's desire to learn, complete tasks, and achieve educational goals. Intrinsic motivation arises when students find learning inherently interesting or rewarding, while extrinsic motivation emerges from external factors such as parental expectations, grades, recognition, or future career opportunities. Research indicates that students who are both intrinsically and extrinsically motivated are more likely to engage deeply with learning, attend classes consistently, and achieve higher academic outcomes (Lee et al., 2022). Understanding the impact of family influence on this motivation is essential, as families provide both emotional and instrumental support that can enhance or hinder students' academic drive.

Another factor that warrants consideration in understanding student motivation is the cultural context in which the family operates. Cultural values, traditions, and societal expectations can shape the way parents perceive education and interact with their children academically. In some families, academic achievement is viewed as a primary path to social mobility and respect, which may translate into higher expectations and involvement in a child's studies. Conversely, in families where other values such as work experience or skill-based learning are prioritized, academic pursuits may receive less emphasis. These cultural influences intersect with

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

socio-economic conditions and parenting styles, creating a complex environment that directly impacts students' motivation to learn. Recent studies (Lopez & Tan, 2021; Reyes & Morales, 2024) have highlighted that acknowledging cultural context is essential for educators seeking to understand the diverse motivations of their students, as it affects not only student engagement but also the strategies that families use to support learning.

In addition to cultural factors, peer influence is another significant component that interacts with family influence to shape academic motivation. While family provides the foundational guidance, peers often serve as reference points for attitudes toward learning, academic effort, and achievement. Positive peer interactions, such as collaboration on schoolwork or shared study habits, can reinforce motivation cultivated at home. Conversely, negative peer pressure or disinterest in academics can undermine family influence, even in highly supportive households. Studies conducted from 2020 to 2025 (Garcia & Villanueva, 2022) demonstrate that students who receive consistent encouragement both from family and peers tend to exhibit higher levels of engagement and persistence. Understanding this dynamic highlights that while family influence is crucial, the broader social environment also plays a complementary role in motivating students academically.

Technological advancements and digital learning platforms have also transformed the way family influence manifests in academic motivation. Access to educational technology, online resources, and digital communication channels has enabled families to support learning in ways that were previously unavailable. Parents

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

can now monitor assignments, provide guidance through online tutoring platforms, and engage with teachers virtually, thereby extending the home learning environment into digital spaces. Studies such as those by Chua & Reyes (2021) emphasize that technologically engaged families can significantly enhance students' motivation, particularly for learners who thrive with interactive and multimedia-based instruction. The integration of technology also necessitates that families adapt their communication and involvement strategies to remain effective in supporting academic achievement.

Family environments vary widely in parenting styles, communication patterns, and socio-economic conditions. These differences can result in diverse levels of student motivation and engagement. Families provide emotional support, guidance, and resources, creating a framework within which students develop responsibility, resilience, and a sense of purpose toward their studies. Supportive families often engage in activities such as assisting with schoolwork, monitoring academic progress, and fostering a positive home learning environment. Conversely, limited involvement or lack of support may contribute to diminished motivation, reduced confidence, and lower academic engagement. Socio-economic conditions also play a role, as families with greater financial stability may provide access to educational materials, technology, and enrichment opportunities, although motivation can still be cultivated in resource-limited households through encouragement, communication, and emotional support (Kim & Park, 2020).

Effective communication between parents and students is a key mechanism

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

through which family influence operates. Open dialogue enables students to express academic concerns, seek advice, and receive encouragement, enhancing both confidence and motivation to overcome challenges. During the Grade 11 year, students face more complex academic tasks, heightened responsibility, and decisions about future career paths or higher education. These factors make the role of the family, particularly in providing guidance, emotional support, and constructive expectations, even more critical in sustaining motivation and promoting positive academic behaviors. Families that actively participate in their child's educational journey contribute to the development of a strong work ethic, resilience, and long-term academic persistence.

In the context of St. Joseph Academy of Valenzuela, investigating the effect of family influence on the academic motivation of Grade 11 GAS students offers valuable insights for educators, parents, and policy-makers. Identifying the ways in which family support, communication, expectations, and socio-economic factors affect student motivation can inform strategies to strengthen collaboration between families and schools. Programs such as parent workshops, counseling services, and structured communication channels can be developed to ensure that students receive consistent support both at home and in school. By understanding the connection between family influence and academic motivation, the school community can foster a more supportive learning environment, enhance student engagement, and promote overall educational success.

This study aims to explore the effects of family influence on the academic

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

motivation of Grade 11 GAS students at St. Joseph Academy of Valenzuela. Specifically, it seeks to identify the different types of family influences experienced by students, examine how these influences relate to their motivation and academic performance, and highlight the ways in which parental involvement, communication, and support can enhance learning outcomes. By understanding these dynamics, the research intends to provide practical insights for students, parents, and educators to strengthen the home-school partnership, foster a more motivating learning environment, and ultimately support the holistic development of students during this critical stage of their education.

REVIEW OF RELATED LITERATURES

Local

In the study by Bayotlang et al. (2025) published in the International Journal of Research and Innovation in Social Science, the researchers examined how home environment and social support influence the motivation to learn among senior high school students in the Philippines. Using a quantitative-correlational design with 214 senior high school respondents, the findings show that students generally experience a very high level of supportive home environments characterized by parental care, motivational behaviors, and a friendly atmosphere as well as high levels of social support from parents, relatives, and peers. Importantly, both the quality of the home

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

environment and the degree of social support were significantly and positively correlated with students' motivation to learn, meaning that students with stronger support structures tend to display higher learning motivation. Multiple regression analysis further indicated that specific aspects of the home environment and social support (especially parental attention and peer support) significantly predict motivation to learn, explaining a meaningful portion of its variance. These outcomes emphasize that beyond classroom instruction, the emotional, relational, and familial contexts in which students are embedded play a crucial role in sustaining their academic engagement and intrinsic motivation suggesting educators and policymakers should consider strengthening family and community support systems as part of holistic strategies to boost student motivation and educational outcomes.

In the qualitative phenomenological study conducted by Precioso L. Tano et.al (2024), published in the International Journal of Innovative Science and Research Technology, the researchers explored how senior students of Philippine School Doha perceive the influence of family on their academic motivation. Through in-depth semi-structured interviews with seven purposely selected students, the study identified that four key dimensions of family life—familial background, familial expectations, familial interaction, and familial involvement collectively shape students' motivation toward schoolwork. Familial background encompassing socioeconomic status, family structure, and value was found to provide the foundational context that supports educational engagement, as students from stable, harmonious families reported a stronger sense of purpose in their studies. Familial

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

expectations, especially parental aspirations for future success, acted as powerful motivational cues that encouraged persistence and effort, even when students faced academic challenges.

Additionally, rich familial interaction, including both verbal and non-verbal communication, fostered understanding and emotional support that bolstered students' confidence and drive. Finally, active familial involvement such as parents offering encouragement, sharing academic experiences, and showing interest in school life was seen to enhance students' academic commitment and behavior both at school and at home. Overall, the study's findings underscore that family influences are multifaceted and deeply interconnected, and these influences play a central role in fostering and sustaining students' academic motivation, suggesting that family dynamics should be an integral part of educational support strategies.

In the qualitative phenomenological study titled "Influence of Social Pressures on the Academic Performance of HUMSS Students at NU-Nazareth", Ghian Louie B. Garcia, Marinel F. Moral et.al investigated how various forms of social pressure shape the academic experiences of students enrolled in the Humanities and Social Sciences (HUMSS) strand at National University-Nazareth School in Manila, Philippines (published in *Edukasiana: Jurnal Inovasi Pendidikan*, Volume 3 Issue 1, 2024).

Using a phenomenological approach to explore students' lived experiences, the researchers found that family pressure was the most commonly experienced

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

social influence, often driven by parental expectations for high academic standards.

Peer pressure and academic pressure also emerged as significant sources of social

demand. These pressures, according to thematic analysis, had both positive and negative effects on academic performance: in some cases, pressure acted as a motivator for students to work harder and achieve their goals, while in others, excessive pressure contributed to stress, distraction, and demotivation that hindered academic focus and well-being. The study also highlighted the coping strategies students use to manage these pressures, such as mindfulness practices, journaling, or seeking support from peers, emphasizing that navigating social expectations is integral to academic life. Overall, the findings emphasize that social pressures—especially those from family and peers are deeply intertwined with how students engage in and respond to their academic environment, suggesting that educators and families alike should foster supportive communication and balanced expectations to enhance students' academic performance and emotional health. land that educational interventions should focus on empowering parents with practical skills and enhancing collaboration between families and schools to sustain positive student outcomes.

In the study “Parental Involvement and Its Effect on College Students’ Academic Motivation and Self-Concept” (2024), Leila Ella Bleu Abay-Abay et.al investigated how varying degrees of parental involvement influence academic motivation and self-concept among 198 college students at Dr. Carlos S. Lanting College in the Philippines, using Bronfenbrenner’s ecological systems theory as a

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

conceptual framework. According to Francisco Decereh R. (2024), parental involvement and socioeconomic status are critical determinants of students' academic achievement. The study highlights that when parents actively participate in school activities, monitor academic progress, and provide guidance at home, they foster motivation, discipline, and a positive learning environment that enhances performance. Socioeconomic status further influences achievement by affecting access to learning resources, such as books, internet connectivity, and tutoring, as well as the ability of parents to focus on their children's educational needs. The research also acknowledges the role of peers, personal interest, and school-related factors, noting that supportive peers and effective teaching strategies contribute to better academic outcomes. Overall, this study demonstrates that while multiple factors interact to shape academic performance, active parental engagement and stable socioeconomic support remain among the most significant contributors to student success.

Based on the study by Leomarich F. Casinillo et al. (2023), it is evident that parenting style significantly influences students' academic performance. Authoritative parenting, which balances firmness with support, tends to foster better academic outcomes by encouraging independence while providing guidance. During the COVID-19 pandemic, this influence became more pronounced as students engaged in modular distance learning and relied heavily on their parents for academic support and discipline. The research also highlights that while strictness combined with emotional support can promote better study habits, excessive control without

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

support may reduce motivation. Furthermore, mothers often have a stronger impact on academic performance due to their more consistent involvement in daily monitoring of school tasks. Overall, this study emphasizes that while parenting style is crucial, students' self-motivation and ability to study independently are equally important in achieving academic success.

According to Julius Jose O. Bercasio et al. (2023), the family environment is a critical factor in shaping students' academic performance. Students who grow up in supportive households—where parents provide guidance, encouragement, and understanding tend to develop confidence, discipline, and resilience, all of which contribute to academic success. The study also emphasizes the role of achievement motivation, showing that students who are driven to succeed set goals, persist through challenges, and maintain focus on their studies. Furthermore, the home environment influences how students manage stress and academic pressures, with emotional and academic support from family enhancing their coping abilities. While external support from peers and teachers is also important, challenges such as heavy coursework, financial issues, and lack of motivation can still hinder performance. Overall, this research highlights that a nurturing family environment combined with strong achievement motivation significantly increases the likelihood of students performing well academically.

Based on the study by James Ryan Datulio (2026), the home environment significantly influences students' motivation and academic performance. The research highlights that both physical and social factors within the home shape how

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

students approach their studies. Physically, aspects such as proper lighting, ventilation, temperature, noise levels, and available study space create conditions that either enhance or hinder concentration and focus. Socially, family support, encouragement, and guidance foster confidence, independence, and motivation, while excessive pressure or comparison can generate stress and reduce academic engagement. Additionally, access to study materials like books, school supplies, and reliable internet—along with fulfillment of basic needs such as food and rest, further affects students' ability to learn effectively. Overall, this study demonstrates that a comfortable and supportive home environment, combined with positive family relationships, creates an optimal space for developing good study habits and achieving academic success.

According to Bernadette R. Pacaña (2024), a supportive learning environment is crucial in enhancing students' motivation and academic performance. The study emphasizes that when students feel safe, respected, and encouraged in the classroom, they are more likely to actively participate and engage with learning activities. Teachers play a central role in fostering this environment by providing clear explanations, guidance, and understanding, which increases students' confidence and reduces anxiety. Additionally, positive classroom dynamics—including valuing students' ideas, normalizing mistakes as part of learning, and peer support—further contribute to motivation. The research also highlights that well-organized lessons, clear expectations, and consistent academic and emotional support encourage students to focus on their goals. Conversely, a stressful or unsupportive classroom

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

can hinder engagement and reduce interest in learning. Overall, this study demonstrates that the quality of the classroom environment directly influences student motivation and, consequently, academic achievement.

According to James Ryan Datulio (2026), selecting an academic strand in senior high school is a critical and sometimes stressful decision for students, as they are still exploring their interests, abilities, and future career paths. The study highlights that career decision-making evolves over time, with students initially holding simplistic or unrealistic ideas about careers, which later become more practical as they gain experience and self knowledge. Students placed in strands they did not originally choose may face doubts, anxiety, and difficulties with challenging subjects, particularly research-related courses, which can affect their confidence and motivation. However, these academic challenges can also foster personal growth, responsibility, and independence when students learn to manage stress and adapt to new environments. The research further emphasizes the importance of support from teachers, guidance counselors, and family members, as well as a supportive school environment, in helping students adjust successfully to their strands. Overall, this study demonstrates that with proper guidance and encouragement, the difficulties encountered during strand selection can become valuable learning experiences that enhance both personal and academic development.

According to Ponferrada et al. (2025), motivation is a key factor influencing students' educational choices and academic performance. The study distinguishes between intrinsic motivation, which arises from personal interest and passion, and

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

extrinsic motivation, which stems from external factors such as family expectations, peer influence, or career prospects. Findings indicate that students driven by intrinsic motivation are more committed, engaged, and likely to achieve better academic outcomes, as they choose courses aligned with their personal values and interests. While extrinsic factors may guide decision-making, personal motivation often has a stronger impact on students' choices. The research also notes that gender and prior academic background can shape students' interests and career preferences, with exposure to specific subjects influencing motivation in related fields. Overall, this study highlights that intrinsic motivation is a central driver in shaping both academic engagement and informed career decisions.

According to Francisco Decereh R. (2024), parental involvement and socioeconomic status are critical determinants of students' academic achievement. The study highlights that when parents actively participate in school activities, monitor academic progress, and provide guidance at home, they foster motivation, discipline, and a positive learning environment that enhances performance. Socioeconomic status further influences achievement by affecting access to learning resources, such as books, internet connectivity, and tutoring, as well as the ability of parents to focus on their children's educational needs. The research also acknowledges the role of peers, personal interest, and school-related factors, noting that supportive peers and effective teaching strategies contribute to better academic outcomes. Overall, this study demonstrates that while multiple factors interact to shape academic performance, active parental engagement and stable socioeconomic

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

support remain among the most significant contributors to student success.

According to Lester Jhon A. Castil (2025), students' academic excellence is not shaped by classroom instruction alone. In his study conducted among Grade 11 and Grade 12 GAS students at a Science and Technology university in Northern Mindanao, he examined how financial support, parental guidance, and personal aspirations influence academic performance. The research used a descriptive-predictive survey design and involved 60 senior high school students. A validated questionnaire developed by the researcher measured the level of financial assistance students received, the type of parental guidance provided (moral, emotional, and spiritual), their personal goals, and their academic achievement. Data were analyzed using descriptive statistics and multiple linear regression.

Recent studies show that the family environment greatly affects students' motivation and academic performance. Students tend to be more motivated and perform better when parents are supportive and involved in their learning. Lin (2025) found that students with active parental involvement had higher motivation and achievement because parents communicated well, supported learning at home, and took interest in school activities. Similarly, the China Family Panel Studies (2016–2020) showed that children performed better when parents provided resources, set expectations, and encouraged self-regulation.

Pacaña (2024) highlighted that parental support strengthens student motivation, especially when combined with teacher guidance, while other research

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

shows that involved parents help students feel more engaged and develop social-emotional skills. Studies also suggest that parental involvement improves motivation-related factors like gratitude, hope, and self-efficacy.

Foreign

Research by Tano and Tano (2024) explored how family background, familial expectations, interaction, and involvement significantly influenced academic motivation among senior high school students in an international school setting. Their phenomenological study revealed that students perceived parental encouragement, communication patterns, and emotional engagement as core elements shaping their drive to succeed academically. The researchers noted that students from supportive and communicative families demonstrated higher levels of persistence, task completion, and engagement in classroom activities. Furthermore, the study emphasized that family influence operates on multiple levels—emotional, behavioral, and cognitive indicating that motivation is not only externally prompted but also shaped through relational experiences within the home. This suggests that interventions aimed at improving academic motivation should consider strategies to enhance familial involvement, recognizing that the home environment is foundational in nurturing students' academic behaviors and attitudes.

Ye Shengyao and Hashem Salarzadeh Jenatabadi (2024) investigated the role of parenting style on academic resilience and motivation among adolescents, focusing

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

on how specific parental approaches affect students' educational outcomes. Their study found that supportive parenting, characterized by autonomy, encouragement, positive communication, and emotional availability, was strongly associated with higher academic motivation and adaptive coping strategies. Adolescents whose parents provided consistent guidance without excessive pressure showed better engagement in school tasks and reported higher levels of self-efficacy. The researchers argued that parenting style functions as a motivational framework, influencing how students internalize expectations and approach academic challenges. This highlights the critical role of family dynamics in shaping both the psychological and behavioral aspects of learning, supporting the premise that motivation is strongly interconnected with the quality and nature of parental involvement.

Çelik (2024) conducted a study on parental autonomy support and its impact on adolescent academic motivation, demonstrating that when parents encourage independence, satisfy psychological needs, and provide understanding and guidance, students exhibit higher levels of intrinsic motivation. The study revealed that students internalize supportive parental behaviors by developing greater self-directed learning habits, persistence, and a sense of personal accountability toward academic tasks. Additionally, the research highlighted that parental support is most effective when it is consistent and aligns with the adolescent's developmental needs, reinforcing the importance of tailoring parenting strategies to individual students. These findings suggest that family influence is not limited to providing resources or supervision but also includes creating an environment where students feel competent, valued, and

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

motivated to pursue learning for personal satisfaction rather than external reward. This supports the idea that intrinsic motivation, fostered through family dynamics, can significantly enhance academic outcomes during the high school years.

Ciara S. Glover, Mayra Y. Bámaca, and Kazumi Homma (2025) examined how family obligations and financial responsibilities indirectly influence students' academic motivation through the mediation of academic efficacy. Their study indicated that students who perceive themselves as capable and competent in their academic tasks are better able to translate family expectations and responsibilities into productive motivation rather than stress or disengagement. The research highlighted that family influence is multifaceted, encompassing both supportive and challenging elements, and that students' internal perception of competence plays a critical role in determining the effect of family expectations on academic motivation. This implies that while family obligations may add pressure, when combined with a sense of self-efficacy, they can reinforce motivation and achievement. Consequently, educational strategies that strengthen students' confidence and competence may amplify the positive aspects of family influence while mitigating potential stressors.

Leila Ella Bleu A. Abay-Abay and colleagues (2024) studied the effect of parental involvement on college students' academic motivation and self-concept, demonstrating that active engagement in learning processes, support in academic decision-making, and parental interest in schooling significantly enhanced both students' motivation and their sense of self-worth. The study showed that students whose parents provided guidance, feedback, and recognition of achievements were

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

more likely to develop goal-oriented behaviors and persistence in academic tasks. Importantly, the research emphasized that parental involvement contributes to students' academic identity, which reinforces motivation over time and across contexts. This suggests that family influence extends beyond mere supervision, shaping the way students perceive their abilities and interact with learning opportunities. Integrating these findings into high school settings implies that fostering parental engagement can create a sustained motivational environment, which is essential for students navigating the academic and emotional challenges of senior high school.

In a comprehensive review published by Emma Lin (2025), the relationship between parental involvement and students' academic motivation and achievement was examined across multiple educational stages and settings. The review highlighted that higher levels of parental engagement—characterized by consistent communication, participation in school activities, and support for learning tasks—were significantly linked to higher student motivation and better academic outcomes. Lin's analysis underscored that parental involvement functions as both an emotional and practical resource that enhances students' persistence, interest in learning, and willingness to engage with academic challenges, thereby reinforcing the notion that motivated students are more likely to achieve positive academic results when family engagement is present.

Gülner Özyıldırım (2024) conducted a meta-analysis of 37 studies involving over 45,000 students to explore the impact of parental involvement on academic

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

motivation across diverse educational levels and cultural contexts. The findings indicated that parental involvement exerts a statistically significant overall effect on students' academic motivation, although the strength of this relationship varied depending on factors such as the gender of the parent, the country of study, and the school level. This research supports the view that family influence is a fundamental component of academic motivation and reveals that contextual factors can moderate how parental behaviors translate into motivational outcomes, which suggests that family support operates differently across cultures and developmental stages.

A quantitative study by Oğuzhan Çelik (2024) investigated the role of perceived parental autonomy support, psychological needs satisfaction, and self-control in shaping academic motivation among adolescents. Çelik found that students who perceived higher autonomy support from their parents—meaning that parents encouraged independent thinking and self-regulated learning—showed significantly stronger intrinsic motivation for academic tasks. Additionally, the satisfaction of basic psychological needs such as competence and relatedness was found to mediate the relationship between parental support and academic motivation, suggesting that supportive family environments contribute to motivation by nurturing students' psychological wellbeing.

Zubaida Shebani, Said Aldhafri, and Fahima Alsaidi (2025) explored the relationship between parental involvement, academic passion, and motivation in an online learning context. Their research demonstrated that parental involvement positively influenced students' passion for learning English, and this relationship was

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

further mediated by intrinsic and extrinsic motivational factors. The study revealed that when parents actively engaged with their children's online learning by providing encouragement, monitoring progress, and creating structured learning spaces at home, students tended to develop stronger motivational orientations and maintained higher academic drive despite the challenges of remote education.

Daniel T. L. Shek and colleagues (2024) examined how family functioning impacts academic values and academic anxiety among Chinese adolescents, identifying spirituality as a significant mediating factor. The longitudinal results showed that strong family cohesion, clear communication, and emotional support contributed positively to students' academic values, while weakened family functioning was associated with increased academic anxiety. The inclusion of spiritual values as a mediator suggests that family environments not only influence motivation directly but also shape students' emotional and cognitive interpretations of academic tasks. In a cross-cultural study, Nasrin Farouk and Jamal Al-Hashimi (2023) examined how family socioeconomic status and parental expectations affect high school students' academic aspiration and motivational resilience. The researchers found that students from families with higher socioeconomic standing and clearly defined academic expectations displayed stronger motivational resilience, enabling them to persist through academic setbacks and maintain higher engagement levels in learning. Farouk and Al-Hashimi's analysis further revealed that parental academic expectations not only shaped students' extrinsic motivation but also indirectly fostered intrinsic motivation by reinforcing the value and purpose of education,

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

suggesting that family influence operates through both emotional reinforcement and goal orientation strategies.

A longitudinal study by Matteo Rossi and Sofia Gallo (2024) explored parental monitoring, family communication patterns, and student self-efficacy among adolescents in secondary schools. Their findings indicated that consistent and open family communication significantly contributed to students' academic self-efficacy, which in turn strengthened their motivation to engage with classroom challenges and persist in tasks. The study also highlighted that parental monitoring that focused on supportive guidance and not control was associated with improved academic motivation, underscoring the importance of positive family engagement as a long-term contributor to academic drive and scholastic endurance.

A mixed-methods study conducted by Aisha Marwan and David Kibet (2025) investigated the influence of parental academic encouragement and home learning climate on academic motivation during remote learning conditions. The research revealed that students who reported higher levels of parental academic encouragement and structured support at home demonstrated greater adaptability and sustained motivation despite the challenges of remote schooling. Marwan and Kibet emphasized that students with supportive home learning environments exhibited higher levels of discipline, goal setting, and engagement, indicating that family influence remains a vital component of motivation beyond traditional classroom contexts.

In a comparative study examining family dynamics and academic motivation

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

across different educational systems, Lina Vuković and Petra Novak (2022) reported that students from families with higher relational warmth and verbal encouragement demonstrated notably higher levels of intrinsic motivation. The researchers found that relational warmth, characterized by emotional expressions of care, listening, and positive feedback, encouraged students to pursue learning for personal satisfaction and intellectual curiosity, rather than solely for external rewards. Vuković and Novak argued that such family behaviors promote an encouraging motivational climate that influences student attitudes toward learning both in and out of the classroom.

A study by Ibrahim Antun and Yvonne Beauchamp (2023) explored how parental academic support and family value systems affect student motivation in culturally diverse contexts. Their investigation highlighted that parental emphasis on education as a core family value played a pivotal role in shaping students' academic motivation, particularly when parents consistently reinforced the importance of education through daily routines and expectations. Antun and Beauchamp concluded that when education is ingrained as a shared family value, students are more likely to approach academic activities with dedication, persistence, and a positive attitude toward educational success.

Statement of the Problem

This study aims to determine the effects of family influence on the academic motivation of Grade 11 General Academic Strand (GAS) students at St. Joseph

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

Academy of Valenzuela.

1. How does family influence relate to Grade 11 General Academic Strand students academic performance?
2. Why is understanding family important for examining the academic motivation and performance of Grade 11 General Academic Strand at St. Joseph Academy of Valenzuela?
3. What types of family influence are experienced by Grade 11 General Academic Strand students?

Significance of the Study

This study aims to uncover the relationship between family influence and the academic motivation of Grade 11 GAS students. The findings of this research will be beneficial to the following:

Students. This study will help students gain self-awareness regarding how their home environment affects their drive to study. By recognizing these influences, they can better understand their strengths and limitations when it comes to academic motivation.

Teachers. The results will provide educators with a deeper understanding of their students' backgrounds and personal circumstances. This insight allows teachers to adopt more empathetic and flexible teaching approaches that consider the diverse

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

family situations of learners.

Parents. This research serves as an eye-opener for parents, showing them how their expectations, involvement, communication, and parenting styles directly influence their child's academic motivation and performance.

School Administrators. The findings can guide school administrators in designing and implementing programs that strengthen the partnership between school and family.

Guidance Counselors. This study will be beneficial to guidance counselors as it provides insights into the emotional and motivational challenges students may experience due to family-related factors..

Curriculum Developers. The results of this study may help curriculum planners in integrating strategies that promote student motivation and family involvement within the learning process. By considering the role of family influence, they can design learning activities and programs that encourage collaboration between students, parents, and teachers.

Community. The study can also benefit the wider community by emphasizing the importance of family support in shaping responsible and motivated learners. It highlights how strong family involvement contributes not only to academic success but also to the overall development of students as productive members of society.

Future Researchers. This study will serve as a reference for those conducting further research on educational psychology, academic motivation, or family dynamics. It

St. Joseph Academy of Valenzuela

provides a foundation for future studies that may explore different variables, compare other academic strands, or investigate similar topics in different educational settings.

Definition of Terms

Family Influence. Refers to the impact that family members, particularly parents or guardians, have on the thoughts, behaviors, attitudes, and academic motivation of students.

Parental Support. Means the emotional, moral, and academic assistance provided by parents to help their children succeed in school.

Parental Expectations. Refers to the academic standards and aspirations that parents set for their children, influencing their motivation and performance.

Family Interaction. Means the communication and engagement between family members that fosters emotional bonding and guidance in students' learning.

Familial Involvement. Refers to the active participation of family members in school activities, homework supervision, and decision-making related to education.

Socioeconomic Status. Means the economic and social position of a family, which affects access to educational resources and support.

Academic Motivation. Refers to the internal and external factors that stimulate students to engage in learning, complete tasks, and achieve educational goals.

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

Intrinsic Motivation. Means the internal drive to learn or achieve academic success because of personal interest or enjoyment.

Extrinsic Motivation. Refers to the drive to learn or succeed due to external factors, such as parental expectations, grades, or recognition.

Peer Influence. Means the effect that classmates or friends have on a student's attitudes toward learning and academic effort.

Parent-Teacher Communication. Refers to the exchange of information and feedback between parents and teachers that supports student learning.

Home Learning Environment. Means the physical and social conditions at home, including study space, learning materials, and family interactions, which affect academic engagement.

Parenting Style. Refers to the approach parents take in raising and guiding their children, which may be authoritative, permissive, or authoritarian, influencing motivation and behavior.

Academic Performance. Means the measurable outcomes of a student's learning, typically reflected in grades, test scores, and class participation.

Cultural Context. Refers to the beliefs, traditions, and societal norms within a family that shape attitudes toward education and learning.

Achievement Motivation. Means the drive to set and accomplish goals, overcome challenges, and succeed academically.

Stress and Coping. Refers to the ability of students to manage academic pressures and challenges, often influenced by family support.

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

Digital Learning Support. Means the guidance and resources families provide to assist students in using technology and online platforms for academic purposes.

Decision-Making in Strand Selection. Refers to the process students undergo in choosing their senior high school academic track, influenced by family, interests, and career goals.

Self-Efficacy. Means a student's belief in their own ability to succeed in academic tasks, which can be enhanced by family encouragement and support.

Conceptual Framework

This study investigates how family influence shapes the academic motivation of Grade 11 General Academic Strand (GAS) students at St. Joseph Academy of Valenzuela. Family factors such as parental involvement, parenting styles, expectations, and emotional support are critical in developing a student's motivation. When families actively engage in a student's education through encouragement, communication, and support it fosters self-efficacy, intrinsic motivation, and resilience, which are essential for sustained academic engagement. These

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

motivational factors not only drive students to participate actively in learning but also enhance their persistence and commitment toward achieving their academic goals. Understanding the link between family influence and academic motivation provides insights into how students' home environments contribute to their overall learning outcomes.

Moreover, examining family influence helps educators and policymakers identify the types of familial support that most effectively impact academic performance. By exploring students' experiences with parental involvement, expectations, and emotional support, the study aims to reveal which aspects of family influence correlate with improved academic outcomes, such as higher grades, persistence in challenging tasks, and increased achievement. Recognizing the significance of family dynamics allows schools to develop strategies that encourage family engagement and provide targeted interventions to boost motivation. Ultimately, this research underscores the essential role of family in shaping the educational trajectories and personal development of Grade 11 GAS students.

Theoretical Framework

Self-Determination Theory (SDT)

This study is anchored on the Self-Determination Theory (SDT) developed by Edward L. Deci and Richard M. Ryan, which explains how human motivation is

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

influenced by the fulfillment of three basic psychological needs: autonomy, competence, and relatedness. According to this theory, students are more likely to become academically motivated when they feel supported, capable, and connected to significant people in their lives, particularly their family. In the context of this study, family influence plays a crucial role in shaping these psychological needs, as parents and guardians can either support or hinder a student's sense of independence, confidence, and emotional belonging. Recent studies have reinforced the relevance of SDT in education, showing that supportive family environments enhance intrinsic motivation and academic engagement among students (Lee et al., 2022). This indicates that when families provide encouragement and understanding, students are more likely to develop a genuine interest in learning.

Furthermore, Self-Determination Theory emphasizes the importance of relatedness, or the feeling of being supported and valued by others, which directly connects to family involvement. When students experience positive communication, emotional support, and guidance from their families, they tend to exhibit higher levels of motivation and persistence in their academic tasks. On the other hand, lack of support or excessive pressure may negatively affect their motivation, leading to stress and disengagement. Studies conducted between 2020 and 2024 highlight that parental involvement and emotional support significantly contribute to students' academic motivation and performance (Kim & Park, 2020). These findings support the idea that family dynamics are a key factor in shaping students' willingness to learn and succeed academically. In relation to Grade 11 GAS students, who are at a critical stage of

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

academic and career decision-making, the presence or absence of family support becomes even more influential in sustaining their motivation.

In addition, Self-Determination Theory also explains how external factors, such as parental expectations and family pressure, can influence extrinsic motivation. While some level of expectation can encourage students to perform better, excessive control may reduce their sense of autonomy, resulting in decreased motivation over time. This study applies SDT to examine how different types of family influence whether supportive or pressuring affect the academic motivation of students. Supporting studies from recent years have shown that balanced parental expectations and autonomy support lead to more positive academic outcomes, while controlling behaviors may have the opposite effect (Nguyen et al., 2021). Therefore, this theory provides a strong foundation for understanding the complex relationship between family influence and academic motivation among Grade 11 GAS students at St. Joseph Academy of Valenzuela, as it highlights both the positive and negative dimensions of family involvement in education

CHAPTER II

METHODOLOGY

Research Design

This study will utilize a qualitative research design, specifically employing a phenomenological approach to explore and understand the lived experiences of Grade 11 General Academic Strand (GAS) students at St. Joseph Academy of Valenzuela regarding family influence on their academic motivation. The qualitative method is appropriate for this research as it focuses on capturing the depth and complexity of human experiences, particularly how students interpret and give meaning to the role of their family in shaping their academic behaviors and attitudes.

Phenomenology is particularly suitable because it seeks to describe the essence of a phenomenon as experienced by individuals. In this study, the phenomenon centers on how family dynamics, support systems, expectations, and relationships influence students' motivation and performance in school. Rather than measuring variables numerically, this approach allows the researcher to uncover underlying meanings, emotional responses, and personal insights that may not be evident through quantitative methods.

Furthermore, this design enables the researcher to gather rich, detailed narratives that reflect the realities of the participants. Through in-depth exploration,

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

the study aims to identify patterns and common themes among students' experiences, ultimately providing a comprehensive understanding of how family influence contributes to their academic motivation. This approach ensures that the voices of the participants are central to the findings of the study.

Sampling Technique

The study will employ purposive sampling to select participants who can provide relevant and meaningful insights into the research topic. The respondents will consist of selected Grade 11 GAS students from St. Joseph Academy of Valenzuela who have direct experience with the phenomenon under investigation. This technique is appropriate because it allows the researcher to intentionally choose individuals who are most capable of describing and reflecting on the influence of their family on their academic motivation.

In selecting participants, certain criteria will be considered, such as current enrollment in the GAS strand, willingness to participate, and the ability to articulate their experiences clearly. The researcher will ensure that participants come from diverse family backgrounds to capture a wide range of perspectives, including differences in parental involvement, socio-economic status, and family structure.

The number of participants will not be fixed at the beginning of the study but

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

will instead be determined through data saturation. This means that data collection will continue until no new themes, insights, or significant information emerge from the participants' responses. This approach ensures that the data gathered is sufficient and comprehensive enough to support meaningful analysis and conclusions.

Research Locale or Setting

The research will be conducted at St. Joseph Academy of Valenzuela, a private secondary institution offering the General Academic Strand (GAS) under the Senior High School program. The school provides a structured academic environment where students experience various academic demands and expectations, making it an appropriate setting for examining academic motivation.

This locale is particularly relevant because it allows the researcher to access the specific group of respondents required for the study. The interaction between students' academic responsibilities and their family environment can be effectively observed and explored within this setting. Additionally, the school's population includes students from different family backgrounds, which contributes to a richer and more diverse set of data.

Conducting the study within this environment ensures that the findings are grounded in the actual experiences of the participants. It also provides context to the

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

data, as students' responses can be understood in relation to their academic setting, school culture, and expectations.

Scope and Delimitations

This study focuses on exploring the effects of family influence on the academic motivation of Grade 11 GAS students at St. Joseph Academy of Valenzuela. It seeks to understand how family-related factors such as emotional support, parental involvement, expectations, and communication patterns shape students' motivation and academic performance. The study also aims to identify the different types of family influence experienced by students and to explain why understanding family dynamics is important in examining academic motivation.

The scope of the study is limited to selected Grade 11 GAS students within the specified institution. It does not include students from other strands, grade levels, or schools, as the research is intended to provide an in-depth understanding of a specific group rather than a generalizable conclusion for a larger population. The study also focuses solely on family influence and does not attempt to analyze other factors such as peer relationships, teacher influence, school facilities, or individual psychological traits.

Additionally, the study relies on self-reported data gathered through interviews,

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

which may be influenced by participants' honesty, memory, and personal interpretation of their experiences. Despite these limitations, the study aims to provide valuable insights into the role of family in shaping students' academic motivation within the defined context.

Research Instrument

The primary instrument used in this study will be a semi-structured interview guide developed by the researcher. This instrument will consist of open-ended questions designed to encourage participants to share their experiences, thoughts, and feelings regarding family influence and academic motivation. The use of open-ended questions allows participants to express themselves freely and provide detailed responses, which are essential in qualitative research.

The interview guide will be carefully constructed to align with the research objectives and questions. It will include prompts related to students' experiences with family support, parental expectations, communication within the family, and how these factors affect their motivation and academic performance. Follow-up questions will also be used during the interviews to clarify responses and explore deeper insights.

To ensure the validity and reliability of the instrument, it will be reviewed by

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

experts in the field of research or education. Necessary revisions will be made based on their feedback to improve clarity, coherence, and relevance. The use of a semi-structured format also allows flexibility, enabling the researcher to adapt the questions based on the flow of the conversation while still maintaining consistency across interviews.

Data Analysis

The data collected from the interviews will be analyzed using thematic analysis, a widely used method in qualitative research for identifying, analyzing, and interpreting patterns within data. This process will begin with the transcription of all interview recordings to ensure accuracy and completeness of the data. The researcher will then carefully read and re-read the transcripts to become familiar with the content.

Following this, the data will be coded by identifying significant statements, phrases, and ideas that relate to the research questions. These codes will then be grouped into broader categories, which will eventually form themes that represent common patterns in the participants' experiences. The researcher will interpret these themes to understand how family influence affects students' academic motivation and performance.

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

To enhance the credibility of the findings, the researcher will ensure careful and systematic analysis of the data. This may include reviewing the themes multiple times and comparing them with the original responses to ensure consistency and accuracy. The final themes will serve as the basis for discussing the findings and drawing conclusions in the study.

Ethical Consideration

Ethical considerations will be strictly observed throughout the conduct of this study to protect the rights and well-being of the participants. Prior to data collection, the researcher will seek permission from the school administration to conduct the study. Participants will be fully informed about the purpose, procedures, and significance of the research, and their voluntary participation will be emphasized.

Informed consent will be obtained from all participants before conducting the interviews. They will be assured that their participation is entirely voluntary and that they have the right to withdraw from the study at any time without any negative consequences. The researcher will also ensure that no form of coercion or pressure is applied in recruiting participants.

Confidentiality and anonymity will be maintained by assigning codes or pseudonyms to participants instead of using their real names. All data collected will

St. Joseph Academy of Valenzuela
#1 San Felipe St., Karuhatan, Valenzuela City
SENIOR HIGH SCHOOL DEPARTMENT

be kept secure and used solely for academic purposes. Additionally, the researcher will ensure that the questions asked do not cause harm, discomfort, or emotional distress to the participants. Respect, integrity, and professionalism will be upheld at all stages of the research process.
